EXPNO:06 Customize Switch with Network Modules using Cisco Packet

29/ 08/2024 Tracer

Aim: To Customize Switch with Network Modules using Cisco Packet

Tracer

1. Open Cisco Packet Tracer

· Launch Cisco Packet Tracer on your computer.

2. Add a Switch to Your Workspace

- · In the device toolbar (usually on the left side of the screen), locate the "Switches" section.
- · Drag and drop a switch model onto the workspace. For instance, you might choose a model like the "2950" or "2960."

3. Access the Switch's Physical Layout

· Click on the switch in the workspace to open its configuration window. · Navigate to the "Physical" tab to see the switch's physical layout and modules.

4. Add Network Modules

- · In the "Physical" tab, you might see options to add or modify network modules. · Click on the slot where you want to add a module. You can choose from available modules such as different types of Ethernet or Fiber modules.
- · Drag the module from the list of available modules and drop it into the slot on the switch.

5. Configure the Modules

- · After adding the module, switch to the "Config" tab in the switch's configuration window.
 - · Here, you can configure the ports provided by the module. For example, you can set IP addresses, VLAN configurations, and other settings for the new interfaces.

6. Configure the Switch Ports

· Switch to the "Config" tab to configure ports on the switch. Here, you can set

parameters for each port.

- Select the specific port or range of ports you want to configure. You can set parameters such as VLAN assignments, port descriptions, and more.
- · For example:
 - o To configure a port to be in a specific VLAN:
 - Select the port or range of ports.
 - Assign the VLAN ID under the VLAN settings.
 - o To set a description for the port:
 - Enter a description in the "Description" field.

7. Using the CLI for Detailed Configuration

- · Switch to the "CLI" tab for command-line interface access.
- · Enter configuration commands to set up the switch. Here's an example of how to configure VLANs and interface settings via CLI:

```
(T) Copy code
Switch> enable
Switch# configure terminal
! Configure VLAN
Switch(config)# vlan 10
Switch(config-vlan)# name Sales
Switch(config-vlan)# exit
! Configure VLAN interface
Switch(config)# interface vlan 10
Switch(config-if)# ip address 192.168.10.1 255.255.255.0
Switch(config-if)# no shutdown
Switch(config-if)# exit
! Assign ports to VLAN
Switch(config)# interface range fa0/1 - 24
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# exit
! Save the configuration
Switch# write memory
```

8. Save Your Configuration

· Once you've configured the modules and ports, be sure to save your configuration.

Use commands in the CLI (Command Line Interface) if you're using a model that supports CLI commands.

For example:

```
Switch> enable

Switch# configure terminal

Switch(config)# interface range fa0/1 - 24

Switch(config-if-range)# description Connected to LAN

Switch(config-if-range)# no shutdown

Switch(config-if-range)# exit

Switch(config)# vlan 10

Switch(config-vlan)# name Sales

Switch(config-vlan)# exit

Switch(config)# interface vlan 10

Switch(config-if)# ip address 192.168.10.1 255.255.255.0

Switch(config-if)# no shutdown

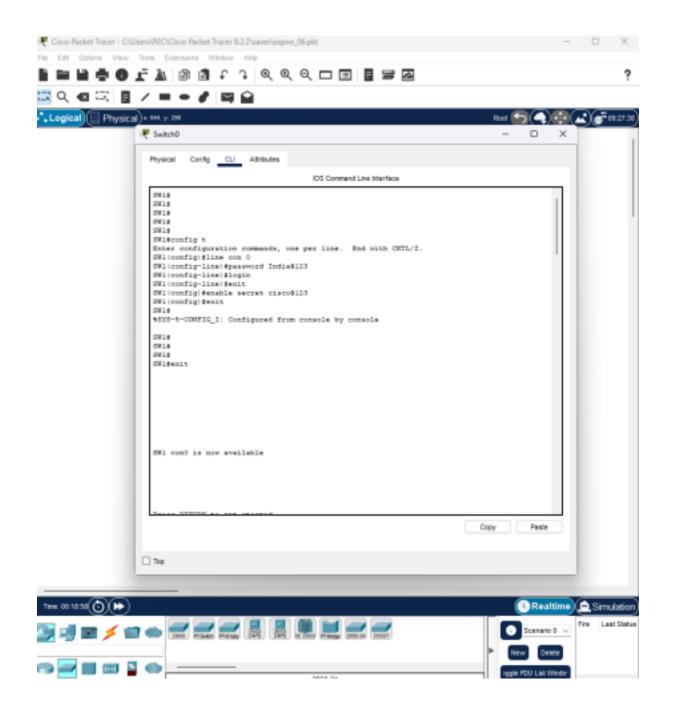

Switch(config-if)# exit

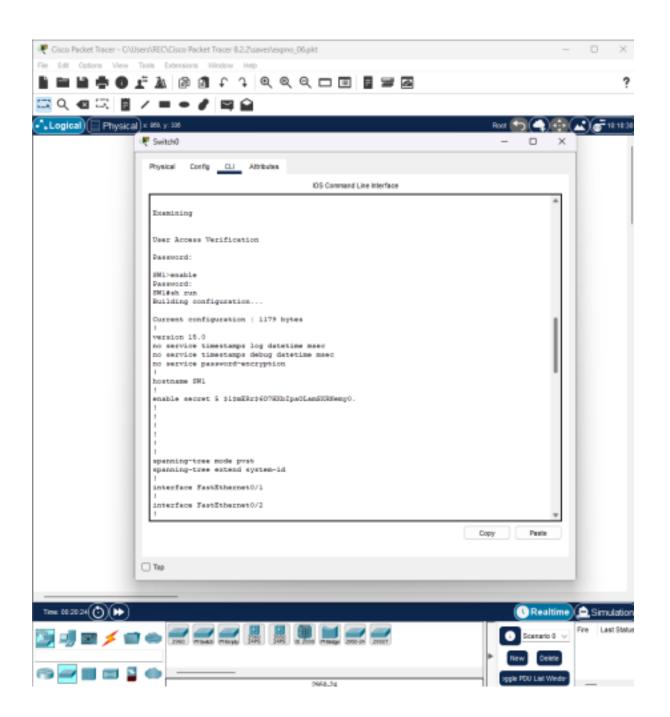

Switch# write memory
```

9. Test Your Configuration

- · Use the simulation mode to test the network configuration.
- · Add devices (PCs, routers, etc.) and connect them to the switch to ensure that everything is working as expected.

Output:

```
🦊 Switch0
                                                                                           ×
           Config CLI Attributes
                                        IOS Command Line Interface
  line con 0
   password India@123
   login
  line vty 0 4
   login
  line vty 5 15
   login
  end
  SW1#
  SW1#copy run startup-config
  Destination filename [startup-config]?
  Building configuration...
  [OK]
  SW1#
                                                                               Сору
                                                                                           Paste
☐ Top
```

Result:

Switch with Network Modules using Cisco Packet Tracer is Customized.
